LipoLite treatments

Effectively treat smaller areas on the face and neck.

Treat stubborn pockets of fat around the belly and back.

Thighs and hips can be shaped with this minimally invasive, more comfortable solution.

When can I expect to see results?

Some results can be seen almost immediately, yet visible improvement will be most noticeable 6-8 weeks after treatment.

Will I need anesthesia?

LipoLite is minimally invasive, and considerably less traumatic to the body than traditional liposuction – so only local anesthesia is required for treatments.

Does it hurt?

Local anesthesia helps make the LipoLite procedure comfortable. After treatment, and when the anesthesia begins to wear-off, many patients experience minimal bruising, plus minor aches and pains that naturally dissipate over time. LipoLite patients typically return to work 1-2 days after treatment.

Am I a good candidate for the LipoLite procedure?

If you are in good health, have stubborn areas of fat, and have good expectations of treatment results, you're a candidate for LipoLite.

How many treatments will I need?

For most patients, only one treatment is typically required. The session may last from 30 minutes to one hour for each area treated.

How much does treatment cost?

Costs vary depending on the areas treated. Typically LipoLite treatments are less expensive than traditional liposuction. Schedule a personalized consultation for more details.

How does LipoLite work?

LipoLite features a tiny tube, called a "cannula," which is inserted through a tiny incision into your skin. A precise, powerful laser beam is directed via an optical fiber through a cannula, and liquefies deposits of fat cells within the treatment area. Liquefied fat is then removed from your body using the same small incision.

What body regions can be treated with LipoLite?

Ideal treatment regions include smaller areas on the face, neck, arms, back, belly, thighs and buttocks. The male breast area can also be treated.
